

DEMO - FactoryLogix Production quick reference (DEMO, not official)

Serialization overview

Keywords: serialization, serial number, unique identifier

Serialization assigns a unique serial number to every unit so that each operation, test result and installed component can be traced across the production route.

Check that the serial label is readable before the first operation.

Escalate to MES Support if duplicate serial numbers are detected.

Pass and Fail results

Keywords: pass, fail, test result, failed unit

A Pass result means the unit met the test or inspection criteria.

A Fail result means the unit did not meet the criteria and a symptom must be recorded before the unit is sent to Repair. Never mark a failed unit as Pass to keep production moving.

Escalate to Quality if the same failure repeats on several units.
